NEA [REDACTED] STAFFING
REQUIREMENTS AS MEASURED BY
AREA DIVISION AVERAGES

No true production or work measurement standards have been established which would permit a factual recommendation on staffing requirements. However, work load statistics are available and do permit a comparison based on averages.

The Division averages were obtained by dividing the total of each separate work load by the total number of on-duty personnel in the respective [REDACTED] of the seven Area Divisions, as shown on the 30 December 1957 IBM T/O listing. Similarly, NEA averages were obtained by dividing the [REDACTED] NEA work load by the [REDACTED] positions responsible for the function.

* These figures are merely an indication of the extent to which NEA deviates from the average work load for each factor. They must be considered in combination, rather than individually, in determining if NEA is over or under-staffed on a comparative basis.
